

Kessai

Instant stablecoin invoice settlement for Japanese SMEs, funded by a 10M yen liquidity pool

The Problem & Our Solution

Japanese SMEs wait 30-60 days to get paid, straining cash flow while banks offer slow, costly financing.

- SMEs face 30-60 day payment delays on B2B invoices
- Banks are slow and expensive for short-term financing
- Kessai tokenizes invoices and advances stablecoins instantly
- A liquidity pool earns a discount fee, buyers repay on due date
- Creates a yield-generating lending business from day one

How It Works

From invoice upload to instant payout: a simple flow powered by Solana smart contracts and stablecoin rails.

- SME uploads invoice, completes simple KYC and credit check
- Invoice is minted as an NFT claim via Anchor program on Solana
- Liquidity pool instantly pays SME in USDC via Solana Pay
- On the due date, the buyer repays the pool automatically
- LP dashboard tracks pool yield, risk exposure and repayments

Built with

Solana, Anchor, Solana Pay, USDC, Next.js, Supabase, Chainlink/Pyth price feed

Why Now & What's Next

Stablecoin rails and RWA tokenization are maturing on Solana, right as Japan's SMEs need faster, cheaper financing.

- Solana stablecoin payment rails and RWA tooling are production-ready
- Japanese SMEs face chronic late-payment cash flow problems
- Next: pilot with 5-10 real SMEs using the seed liquidity pool
- Add credit-scoring model and a default insurance reserve fund
- Partner with Japanese accounting SaaS for invoice data integration
